                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
```

peptide. The method involves removing a saccharyl subunit from the peptide, thus forming a truncated glycan, and contacting the truncated glycan, and contacting the truncated control of glycan with at least one glycosyltaneferase and at least one glycosyl donor conditions suitable to transfer at least one glycosyl donor to the truncated glycan, thus remodeling the peptide. Conjugates can be formed between a granulocyte colony stimulating factor (G-CSP) peptide, interferon beta peptide, reactor (G-CSP) peptide, conterferon beta peptide, expenied, granulocyte macrophage colony stimulating factor (MrcSP) peptide, granulocyte macrophage colony stimulating factor (MrcSP) peptide, interferon-gamma peptide, tissue plasminogen activator (TPA) peptide, interferon-gamma peptide, tissue plasminogen activator (TPA) peptide, interferon-gamma peptide, tissue plasminogen activator (TPA) peptide, interfleukin-2 (IL-2) peptide, vill peptide, interfleukin-2 (IL-2) peptide, urckinase peptide, anti-caceptor/immunoglobulin (IG) G fusion peptide, chimeric anti HERZ creceptor/immunoglobulin (IG) G fusion peptide, anti-colonal antibody peptide, anti-colonal antibody peptide, recombinant DNase peptide, anti-TNF alpha peptide, insulin peptide, recombinant DNase peptide, anti-TNF alpha peptide, insulin peptide, and a modifying group, where the modifying group is covalently attached to the peptide through an intact glycosyl linking group. The method is useful for a cell-free, in vitro method of the colon colo ö Remodeling a peptide, by removing a saccharyl subunit from the peptide to form truncated glycan, and adding or deleting glycosyl groups to a peptide and/or adding modifying group of a peptide to remodel the 61 FAMLSLGTKADTHDEILEGLNFNLTQIPEAQIHEGFQELLRTLNQPDSQLQLTTGNGLFL 120 85 PAMLSLGTKADTHDEILEGLNFNLTEIPEAQIHEGFQELRTLNQPDSQLQLTTGNGLFL 144 9 25 EDPQGDAAQKTDTSHHDQDHPTFNKITPNLAEFAFSLYRQLAHQSNSTNIFFSPVSIATA 84 EDPQGDAAQKTDTSHHDQDHPTFNKITPNLAEFAFSLYRQLAHQSNSTNIFFSPVSIATA invention relates to a cell-free, in vitro method of remodeling a Gaps ö Length 418; Chen X; 3; Indels Bowe C, Hakes D, Score 2003; DB 6; Pred. Composition for treating or preventing neurodegeneration, e.g. Alzheimer's or Parkinson's diseases, contains protease inhibitor, especially alphal-antitrypsin.

Claim 6; SEQ ID NO 2; 40pp; German.

This invention describes a novel composition for treatment or prevention of neurodegenerative disease containing at least one protease inhibitor and which has nootropic, neuroprotective, antiparkinsonian and anticonvulsant activity. The compostions are specifically used to treat or prevent Alzheimer's, Pick's, Huntington's and Parkinson's diseases and also for diagnosis. DNA sequences that encode alpha-1-antitrypsin (aaT), or its fragments, are useful for isolating homologous RNA or DNA sequences, and for recombinant production of aaT in gene therapy. This sequence represents the human alpha-1-antitrypsin (SWISS PROT No: P01009) used in the composition of the invention.

or human polynuclectides or composition computating two or more instruction of the nucleic acid sequence. Also derivative or allelic variation of the nucleic acid sequence. Also calaimed are a vector comprising the novel polynuclectide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynuclectide sequence that is differentially expressed in neuronal tissue of a first animal compound of a polynuclectide sequence which is differentially expressed in animal subjected to pain, a method for identifying a compound which regulates the expression of a polynuclectide sequence which is differentially expressed in animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynuclectides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of the polypeptides given in the activity in an animal of one or more of the polypeptides given in the apprehence of the paramaceutical composition comprising the one or more polypeptides or their antibodies. The polymuclectide or the compound that modulates its activity is useful for preparing a medicament for treating pain and a pharmaceutical composition comprising the one or more therapy). The sequence presented is a human protein (shown in Table 2 of the sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at the wipo.int/pub/published_pot_general control control control of the printed specification, but was obtained in electronic form directly form WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Befort K, Costigan M; Woolf C, D'urso D,

WPI; 2003-268312/26. GENBANK, P01009. New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

Claim 1; Page; 1017pp; English.

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polyneptides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more pain and a pharmaceutical composition comprising the one or more polyneptides or their antibodies. The polynucleotide or the compound that

modulates its activity is useful for preparing a medicament for treating plun (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification) which is differentially expressed during pain. Note: the sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, or human polynucleotides or a polynucleotide acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that is differentially expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence the expression of a polynucleotide sequence which is differentially expression of a polynucleotide or more of the compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more plain and a pharmaceutical composition comprising the one or more polymeptides or their antibodies. The polynucleotide or the compound that confirm (c.g. spinal segmental nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the sequence data for this patent did not form part of the printed the sequence data for this patent did not form part of the printed the sequence data for this patent did not form part of the printed the sequence data for this patent did not form part of the printed to the sequence data for this patent did not form part of the printed to the content of the printed to the content of the printed to the content o

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   US-09-023-339-1

Sequence 1, Application US/09023339

Sequence 1, Application US/09023339

FREEL NO. 6127145

GENERAL INFORMATION:

APPLICANT: Sutliff, Thomas D.

APPLICANT: Rodriguez, Raymond L.

TILLE OF INVENTION: Production of '1-Antitrypsin'

TITLE OF INVENTION: In Plants

NUMBER OF SEQUENCES: 22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   361 PPEVKFNKPFVFLMIEQNTKSPLFMGKVVNPTGK 394
